

With Visible Developer You Can...

Moderization of Legacy Applications can't be easier.

Work Smarter and Faster...

Visible Developer's model-based approach to application design and development lets you spend more time solving business problems and less time sweating technical details.

Visible Developer generates up to 95% of the business logic from your application model. Its "code patterns" translate the model into robust, modular, well-documented code.

Compare **Visible Developer** to similar products. Only Visible Developer helps you produce executable code when building or modernizing your n-tier business applications.

Take Advantage of New Technologies

Generated applications incorporate best programming practices for N-tiered architectures.

Leverage Your Existing Database Design

You can extract database schema information (tables, fields, data types, relationship, keys, etc.) from your existing databases.

Generate Code

Code patterns exist for VB, ASP, VB.NET, C# and ASP.NET.

Design Business Objects

Use familiar design concepts (properties, methods, views, and rules) to express business requirements. These design choices result in generated code that is close to your final application.

Synchronize After Changing Database Design

Synchronize your applications with modifications made to the database schema.

Roundtrip Software Development

Refine your generated code by adding business rule logic between edit points. Then, if you must regenerate the code, your customized changes are preserved.

Learn By Doing

Learn 3-tier application development by examining working code. Components generated by Visible Developer are extensively documented. A tutorial takes you through the process step-by-step.

"Visible Developer is a real gem because it not only implements best practices, but also teaches you why they are best practices. After several years of doing only MS-Access development, I've had a huge learning curve with the transition to .NET and SQL Server. Visible Developer has dramatically eased that burden in two ways: letting me build a (mostly) functional application through the use of a powerful and intuitive designer (Visible Developer itself); giving me a 'custom study guide' in the form of well-written, nicely structured code that directly addresses the business problem I'm trying to solve. I've learned more about thinking in "objects" working with Visible Developer than I've learned in the last ten years."
